## Abstract

In this paper we introduce a new class of sets namely,  $\hat{g}^{**}$ s-closed sets, which is settled in between the class of  $g^*$ s-closed sets and the class of  $gs$ -closed sets. Also, we compared it with other generalized closed sets and we find that the union of two  $\hat{g}^{**}$ s-closed sets is not an  $\hat{g}^{**}$ s-closed set and the intersection of two  $\hat{g}^{**}$ s-closed sets is again an  $\hat{g}^{**}$ s-closed set.

**Keyword:**  $\hat{g}^{**}$ s-closed sets,  $g^*$ s-closed sets,  $gs$ -closed sets.

## I. INTRODUCTION

Levine introduced the class of semi open sets in 1963[11]and  $g$ -closed sets[12] in 1970.M.K.R.S.Veera Kumar defined  $\hat{g}$ -closed sets[7] in 2001 and  $\hat{g}^*$ -closed sets[9] in 1996. The authors introduce a new class of sets called  $\hat{g}^{**}$ s-closed sets, which properly placed in between the class of  $g^*$ s-closed sets and the class of  $gs$ -closed sets.

## II.PRELIMINARIES

Throughout this paper  $(X, \tau)$  represent the non-empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $cl(A)$  and  $int(A)$  denote the closure and interior of  $A$  respectively.

### A. Definition:

A subset  $A$  of a topological space  $(X, \tau)$  is called

- 1) A semi-open set [11] if  $A \subseteq cl(int(A))$  and a semi-closed set if  $int(cl(A)) \subseteq A$ .
- 2) A semi pre-open set[1] if  $A \subseteq cl(int(cl(A)))$  and a semi pre-closed set if  $int(cl(int(A))) \subseteq A$ .
- 3) An  $\alpha$ -open set [3] if  $A \subseteq int(cl(int(A)))$  and an  $\alpha$ -closed set if  $cl(int(cl(A))) \subseteq A$ .
- 4) A regular open set[16] if  $A = int(cl(A))$  and a regular closed set if  $A = cl(int(A))$ .

### B. Definition:

A subset  $A$  of a topological space  $(X, \tau)$  is called

- 1) A generalized closed set (briefly  $g$ -closed) [12] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 2) A generalized semi-closed set (briefly  $gs$ -closed) [15] if  $scl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 3) A  $\hat{g}$ -closed or ( $w$ -closed) [7] set if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is semi open in  $(X, \tau)$ .
- 4) A generalized pre-closed set (briefly  $gp$ -closed) [3] if  $pcl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 5) A  $g^*$ -closed set[6] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
- 6) A  $\hat{g}^*$ -closed or ( $*g$ -closed) set[9] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .
- 7) A  $g^{**}$ -closed set[8] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .
- 8) A  $g^*$ s-closed set[4] if  $scl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $gs$ -open in  $(X, \tau)$ .
- 9) A  $\hat{g}^*$ s-closed set[14] if  $scl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .
- 10) A  $g^*$ s\*-closed set [or ( $sg^*$ -closed set) or ( $(sg)^*$ -closed set)] [10] if  $scl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .
- 11) A  $gs^{**}$ -closed set[2] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $gs^*$ -open in  $(X, \tau)$ .
- 12) A  $gs^*$ -closed set or [ $(gs)^*$ -closed sets] [5] if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $gs$ -open in  $(X, \tau)$ .

### C. Results:

- 1)Every  $\hat{g}^*$ -closed sets are  $gs$ -closed set. [9]
- 2)Every  $\hat{g}^*$ -closed sets are  $g$ -closed set. [9]
- 3)Every closed sets are  $\hat{g}^*$ -closed set. [9]
- 4)Every  $g^*$ -closed sets are  $\hat{g}^*$ -closed set. [9]

### D. Notations used:

- 1)  $scl(A)$  – semi closure of  $A$ .
- 2)  $pcl(A)$ – pre-closure of  $A$ .

## III. BASIC PROPERTIES OF $\hat{g}^{**}$ s-CLOSED SETS

We now introduce the following definitions.

**Definition: 3.1**

A subset  $A$  of a topological space  $(X, \tau)$  is called a  $\hat{g}^{**}s$ -closed set if  $scl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open in  $(X, \tau)$ .

**Theorem:3.2**

Every closed set is  $\hat{g}^{**}s$ -closed.

**Proof:**

Let  $A$  be a closed set in  $X$ .

Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.

Since  $A$  is closed  $cl(A) \subseteq U$ .

But  $scl(A) \subseteq cl(A) \subseteq U$

$\Rightarrow scl(A) \subseteq U$ .

Hence  $A$  is  $\hat{g}^{**}s$ -closed.

**Remark: 3.3**

Example:3.4 shows that the converse of the above theorem is not true

**Example:3.4**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  $A = \{b\}$  is  $\hat{g}^{**}s$ -closed but not closed.

**Theorem: 3.5**

Every semi closed set is  $\hat{g}^{**}s$ -closed.

**Proof:**

Let  $A$  be a semi closed set in  $X$ .

Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.

Since  $A$  is semi-closed,  $scl(A) \subseteq U$ .

Hence  $A$  is  $\hat{g}^{**}s$ -closed.

**Remark: 3.6:**

Example:3.7 shows that the converse of the above theorem is not true

**Example: 3.7**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{c\}, \{b, c\}\}$ ,

$A = \{a, c\}$  is  $\hat{g}^{**}s$ -closed but not semi-closed.

**Theorem: 3.8**

Every  $\alpha$ -closed set is  $\hat{g}^{**}s$ -closed.

**Proof:**

Let  $A$  be a  $\alpha$ -closed set in  $X$ .

Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.

Since  $A$  is  $\alpha$ -closed,  $\alpha cl(A) = A \subseteq U$ .

$\Rightarrow \alpha cl(A) \subseteq U$ .

But every  $\alpha$ -closed set is semi-closed.

$\Rightarrow scl(A) \subseteq U$ .

Hence  $A$  is  $\hat{g}^{**}s$ -closed.

**Remark: 3.9**

Example:3.10 shows that the converse of the above theorem is not true

**Example: 3.10**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a, b\}\}$ ,

$A = \{b\}$  is  $\hat{g}^{**}s$ -closed but not  $\alpha$ -closed.

**Theorem: 3.11**

Every regular closed set is  $\hat{g}^{**}s$ -closed.

**Proof:**

Let  $A$  be a regular closed set in  $X$ .

Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.

Since  $A$  is regular-closed,  $rcl(A) \subseteq U$ .

But  $scl(A) \subseteq rcl(A) \subseteq U$ .

$\Rightarrow scl(A) \subseteq U$ .

Hence  $A$  is  $\hat{g}^{**}s$ -closed.

**Remark: 3.12:**

Example:3.13 shows that the converse of the above theorem is not true

**Example: 3.13**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  $A = \{c\}$  is  $\hat{g}^{**}s$ -closed but not  $r$ -closed.

**Theorem: 3.14**

Every  $g^*s$ -closed set is  $\hat{g}^{**}s$ -closed.

**Proof:**

Let  $A$  be a  $g^*s$ -closed set in  $X$ .

Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.

But all  $\hat{g}^*$ -open sets are  $gs$ -open.

Thus  $A \subseteq U$  and  $U$  is  $gs$ -open.

$\Rightarrow scl(A) \subseteq U$ . [Since  $A$  is  $g^*s$ -closed set]

Hence  $A$  is  $\hat{g}^{**}s$ -closed.

**Remark: 3.15:**

Example:3.16 shows that the converse of the above theorem is not true

**Example:3.16**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{b, c\}\}$ ,  
 $A = \{b\}$  is  $\hat{g}^{**}$ -s-closed but not  $g^*$ -s-closed.

**Theorem: 3.17**

Every  $g^*$ -closed set is  $\hat{g}^{**}$ -s-closed.

**Proof:**

Let  $A$  be a  $g^*$ -closed set in  $X$ .  
 Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.  
 But all  $\hat{g}^*$ -open sets are  $g$ -open sets.  
 Thus  $A \subseteq U$  and  $U$  is  $g$ -open.  
 $\Rightarrow cl(A) \subseteq U$ . [Since  $A$  is  $g^*$ -closed set]  
 But  $scl(A) \subseteq cl(A) \subseteq U$   
 $\Rightarrow scl(A) \subseteq U$ .  
 Hence  $A$  is  $\hat{g}^{**}$ -s-closed.

**Remark: 3.18:**

Example:3.19 shows that the converse of the above theorem is not true

**Example: 3.19**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{b, c\}\}$ ,  
 $A = \{b\}$  is  $\hat{g}^{**}$ -s-closed but not  $g^*$ -closed.

**Theorem: 3.20**

Every  $(gs)^*$ -closed set is  $\hat{g}^{**}$ -s-closed.

**Proof:**

Let  $A$  be a  $(gs)^*$ -closed set in  $X$ .  
 Let  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.  
 But all  $\hat{g}^*$ -open sets are  $gs$ -open sets.  
 Thus  $A \subseteq U$  and  $U$  is  $gs$ -open.  
 $\Rightarrow cl(A) \subseteq U$ . [Since  $A$  is  $(gs)^*$ -closed set]  
 But  $scl(A) \subseteq cl(A) \subseteq U$   
 $\Rightarrow scl(A) \subseteq U$ .  
 Hence  $A$  is  $\hat{g}^{**}$ -s-closed.

**Remark: 3.21:**

Example:3.22 shows that the converse of the above theorem is not true

**Example: 3.22**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  $A = \{b\}$  is  $\hat{g}^{**}$ -s-closed but not  $(gs)^*$ -closed.

**Theorem: 3.23**

Every  $\hat{g}^{**}$ -s-closed set is  $gs$ -closed.

**Proof:**

Let  $A$  be a  $\hat{g}^{**}$ -s-closed set in  $X$ .  
 Let  $A \subseteq U$  and  $U$  is open.  
 But all open sets are  $\hat{g}^*$ -open sets.  
 Thus  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.  
 $\Rightarrow scl(A) \subseteq U$ . [Since  $A$  is  $\hat{g}^{**}$ -s-closed set]  
 Hence  $A$  is  $gs$ -closed.

**Remark: 3.24:**

Example:3.25 shows that the converse of the above theorem is not true

**Example:3.25**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  
 $A = \{a, b\}$  is  $ags$ -closed but not  $\hat{g}^{**}$ -s-closed.

**Theorem: 3.26**

Every  $\hat{g}^{**}$ -s-closed set is  $(sg)^*$ -closed.

**Proof:**

Let  $A$  be a  $\hat{g}^{**}$ -s-closed set in  $X$ .  
 Let  $A \subseteq U$  and  $U$  is open.  
 But all  $g^*$ -open sets are  $\hat{g}^*$ -open sets.  
 Thus  $A \subseteq U$  and  $U$  is  $\hat{g}^*$ -open.  
 $\Rightarrow scl(A) \subseteq U$ . [Since  $A$  is  $\hat{g}^{**}$ -s-closed set]  
 Hence  $A$  is  $(sg)^*$ -closed.

**Remark: 3.27:**

Example:3.28 shows that the converse of the above theorem is not true

**Example: 3.28**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  
 $A = \{a, b\}$  is  $(sg)^*$ -closed but not  $\hat{g}^{**}$ -s-closed.

**Remark: 3.29**

$\hat{g}^*s^*$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^*s^*$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}s$ -closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $\hat{g}^*s^*$ -closed set but not a  $\hat{g}^{**}s$ -closed set.

Hence, a  $\hat{g}^*s^*$ -closed set need not be a  $\hat{g}^{**}s$ -closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space  $\tau_2 = \{\phi, X, \{a\}, \{b, c\}\}$ .

Let  $A = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^{**}s$ -closed set and  $B = \{\phi, X, \{a\}, \{b, c\}\}$  is a  $\hat{g}^*s^*$ -closed set in the topological space  $\tau_2$ .

Here, the sets  $\{b\}, \{c\}, \{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{b\}, \{c\}, \{a, b\}$  and  $\{a, c\}$  are a  $\hat{g}^{**}s$ -closed set but not a  $\hat{g}^*s^*$ -closed set.

Hence, a  $\hat{g}^{**}s$ -closed set need not be a  $\hat{g}^*s^*$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $\hat{g}^*s^*$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Remark: 3.30**

$gs^{**}$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $gs^{**}$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}s$ -closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $gs^{**}$ -closed set but not a  $\hat{g}^{**}s$ -closed set.

Hence, a  $gs^{**}$ -closed set need not be a  $\hat{g}^{**}s$ -closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space

$$\tau_2 = \{\phi, X, \{c\}, \{b, c\}\}.$$

Let  $A = \{\phi, X, \{a\}, \{a, b\}, \{a, c\}\}$  is  $\hat{g}^{**}s$ -closed set and  $B = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  is a  $gs^{**}$ -closed set in the topological space  $\tau_2$ .

Here, the set  $\{b\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the set  $\{b\}$  is a  $\hat{g}^{**}s$ -closed set but not a  $gs^{**}$ -closed set.

Hence, a  $\hat{g}^{**}s$ -closed set need not be a  $gs^{**}$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $gs^{**}$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Remark: 3.31**

$\hat{g}^*$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^*$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}s$ -closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $\hat{g}^*$ -closed set but not a  $\hat{g}^{**}s$ -closed set.

Hence, a  $\hat{g}^*$ -closed set need not be a  $\hat{g}^{**}s$ -closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space

$$\tau_2 = \{\phi, X, \{a\}, \{b, c\}\}.$$

Let  $A = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^{**}s$ -closed set and  $B = \{\phi, X, \{a\}, \{b, c\}\}$  is a  $\hat{g}^*$ -closed set in the topological space  $\tau_2$ .

Here, the sets  $\{b\}, \{c\}, \{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{b\}, \{c\}, \{a, b\}$  and  $\{a, c\}$  are a  $\hat{g}^{**}s$ -closed set but not a  $\hat{g}^*$ -closed set.

Hence, a  $\hat{g}^{**}s$ -closed set need not be a  $\hat{g}^*$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $\hat{g}^*$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Remark: 3.32**

$g^{**}$ -closed and  $\hat{g}^{**}s$ -closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $g^{**}$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $g^{**}$ -closed set but not a  $\hat{g}^{**}$ -s-closed set.

Hence, a  $g^{**}$ -closed set need not be a  $\hat{g}^{**}$ -s-closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space  $\tau_2 = \{\phi, X, \{c\}, \{b, c\}\}$ .

Let  $A = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set and  $B = \{\phi, X, \{a\}, \{a, b\}, \{a, c\}\}$  is a  $g^{**}$ -closed set in the topological space  $\tau_2$ .

Here, the sets  $\{b\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the set  $\{b\}$  is a  $\hat{g}^{**}$ -s-closed set but not a  $g^{**}$ -closed set.

Hence, a  $\hat{g}^{**}$ -s-closed set need not be a  $g^{**}$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $g^{**}$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Remark: 3.33**

$sp$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a, b\}\}$ .

Let  $A = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$  is a  $sp$ -closed set and  $B = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a\}$  and  $\{b\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a\}$  and  $\{b\}$  are a  $sp$ -closed set but not a  $\hat{g}^{**}$ -s-closed set.

Hence, a  $sp$ -closed set need not be a  $\hat{g}^{**}$ -s-closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space  $\tau_2 = \{\phi, X, \{c\}, \{b, c\}\}$ .

Let  $A = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$  is  $\hat{g}^{**}$ -s-closed set and  $B = \{\phi, X, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$  is a  $sp$ -closed set in the topological space  $\tau_2$ .

Here, the set  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the set  $\{a, c\}$  is a  $\hat{g}^{**}$ -s-closed set but not a  $sp$ -closed set.

Hence, a  $\hat{g}^{**}$ -s-closed set need not be a  $sp$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $sp$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Remark: 3.34**

$gp$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $gp$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $gp$ -closed set but not a  $\hat{g}^{**}$ -s-closed set.

Hence, a  $gp$ -closed set need not be a  $\hat{g}^{**}$ -s-closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space  $\tau_2 = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$ .

Let  $A = \{\phi, X, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set and  $B = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$  is a  $gp$ -closed set in the topological space  $\tau_2$ .

Here, the sets  $\{a\}$  and  $\{b\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a\}$  and  $\{b\}$  are a  $\hat{g}^{**}$ -s-closed set but not a  $gp$ -closed set.

Hence, a  $\hat{g}^{**}$ -s-closed set need not be a  $gp$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that,  $gp$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Remark: 3.35**

$g$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topological space  $\tau_1 = \{\phi, X, \{a\}\}$ .

Let  $A = \{\phi, X, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  is a  $g$ -closed set and  $B = \{\phi, X, \{b\}, \{c\}, \{b, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set in the topological space  $\tau_1$ .

Here, the sets  $\{a, b\}$  and  $\{a, c\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $g$ -closed set but not a  $\hat{g}^{**}$ -s-closed set.

Hence, a  $g$ -closed set need not be a  $\hat{g}^{**}$ -s-closed set.  $\rightarrow$  (1)

Similarly, Consider the topological space

$$\tau_2 = \{\phi, X, \{c\}, \{b, c\}\}.$$

Let  $A = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set and  $B = \{\phi, X, \{a\}, \{a, b\}, \{a, c\}\}$  is a  $g$ -closed set in the topological space  $\tau_2$ .

Here, the set  $\{b\}$  belongs to  $A$  but does not belongs to  $B$ .

Therefore, the sets  $\{a, b\}$  and  $\{a, c\}$  are a  $\hat{g}^{**}$ -s-closed set but not a  $g$ -closed set.

Hence, a  $\hat{g}^{**}$ -s-closed set need not be a  $g$ -closed set.  $\rightarrow$  (2)

Therefore, from (1) and (2), we can say that  $g$ -closed and  $\hat{g}^{**}$ -s-closed sets are independent.

**Remark: 3.36**

Union of two  $\hat{g}^{**}$ -s-closed sets need not be  $\hat{g}^{**}$ -s-closed.

**Proof:**

Let  $X = \{a, b, c\}$ . Consider the topology

$$\tau = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}.$$

Here,  $\{\phi, X, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$  is a  $\hat{g}^{**}$ -s-closed set.

Consider, two  $\hat{g}^{**}$ -s-closed elements  $A = \{a\}$  and  $B = \{b\}$ .

Here  $A$  and  $B$  are  $\hat{g}^{**}$ -s-closed sets but

$A \cup B = \{a\} \cup \{b\} = \{a, b\}$  is not  $\hat{g}^{**}$ -s-closed set.

**Theorem: 3.37**

Let  $A$  and  $B$  be any two  $\hat{g}^{**}$ -s-closed sets in a topological space  $X$ . Then  $A \cap B$  is also a  $\hat{g}^{**}$ -s-closed set in  $X$ .

**Proof:**

Let  $A$  and  $B$  be any two  $\hat{g}^{**}$ -s-closed sets.

Then  $A \subseteq U$ ,  $U$  is a  $\hat{g}^*$ -open set and  $B \subseteq U$ ,  $U$  is a  $\hat{g}^*$ -open set.

Hence,  $scl(A) \subseteq U$  and  $scl(B) \subseteq U$ .

Therefore,  $scl(A \cap B) \subseteq scl(A) \cap scl(B) \subseteq U \Rightarrow scl(A \cap B) \subseteq U$ ,  $U$  is a  $\hat{g}^*$ -open set in  $X$ .

Hence,  $A \cap B$  is also a  $\hat{g}^{**}$ -s-closed set in  $X$ .

**Remark: 3.38**

From the above discussion, we obtain the following implications.
